Field of the Invention The present invention relates generally to an orthotic for improving the function of the foot, and, in particular, to a sole for a foot and an orthotic with improved cushioning properties. 2. Description of the Related Art Many individuals who have impaired foot function experience pain and discomfort as a result of being forced to perform activities with an otherwise normal foot. For example, in some instances, an individual with an otherwise normal foot may experience pain and discomfort when walking, running, or participating in any other type of sporting activity. Such pain and discomfort may be experienced by individuals, such as, for example, athletes, soldiers, or people with other physical challenges such as arthritis. Such individuals may also experience pain and discomfort when standing or sitting in an otherwise normal position for a prolonged period of time. Such pain and discomfort often result from the foot functioning properly and becoming pronated, meaning that the bones of the foot rotate too much during stance and/or gait. The pronation may be experienced as excessive inward or outward rolling of the foot, or both, which in some instances may lead to muscle fatigue and injury. Such injuries may include, for example, stress fractures or muscle tears, among other types of injuries. While certain orthotics have been developed for treating various foot and/or ankle conditions, these orthotics have not been designed to address or reduce the pronation of the foot. Therefore, there is a need in the art for improved orthotics that may be used to reduce foot pronation.Sen.
